

Dear Hiring Manager,

I am writing to apply for the ESG Data Analyst position at TDi Sustainability. I was particularly drawn to this opportunity because it combines data analysis, investigative research, sustainability, and digital tools to support better decision-making across complex global supply chains.

My background is in geospatial intelligence, data analysis, and geoscience, with hands-on experience in collecting, cleaning, interpreting, and presenting complex datasets. In my recent roles, I have worked with GIS datasets, spatial analysis, Python-based data processing, technical reporting, and risk-related assessments for maritime and infrastructure projects. This has strengthened my ability to work carefully with data, identify patterns and inconsistencies, and translate technical findings into clear outputs for decision-makers.

What interests me most about TDi is the practical impact of the work. The role is not only about managing datasets, but also about turning ESG information, standards, and research into useful insights, dashboards, scoring frameworks, and client-facing tools. I believe my experience in spatial data analysis, data quality control, Python, ArcPy, statistical analysis, and technical documentation would allow me to contribute strongly to your data and digital platform work.

I also bring a strong research mindset. As a PhD candidate in Geoscience and Energy Engineering, I am used to working methodically, reviewing evidence, handling technical uncertainty, and producing structured analysis. In previous roles, I have supported data acquisition and preprocessing, validated and cleaned datasets, generated maps and reports, and contributed to workflow improvements. These experiences align closely with the accuracy, curiosity, and attention to detail required for this position.

Although my background is more focused on geospatial and environmental data than traditional ESG reporting, I am highly motivated to develop further in ESG frameworks, responsible sourcing, sustainability standards, and supply chain due diligence. I am confident that my technical foundation, analytical mindset, and ability to learn quickly would help me grow within the role and contribute meaningfully to TDi's mission.

I would welcome the opportunity to discuss how my skills in data analysis, GIS, Python, research, and technical communication can support TDi Sustainability's advisory and digital work.

Thank you for considering my application. I look forward to hearing from you.

Sincerely,
Abdelilah Daoulhadj
